

STAR PROGETTI
TECNOLOGIE APPLICATE

Who we are

Star Progetti is the international leader in the design and production of electric infrared heaters.

Born in the early 1990s, with the introduction of the famous Fungo® gas heater, Star Progetti has revolutionized the hospitality and open area heating sector throughout Europe.

Today the company is already serving 5000+ customers over 60 countries worldwide by providing them with complete heating and cooling solutions for outdoor areas and semi-opened areas where traditional heating or air-conditioning solutions cannot be implemented or result in excessive energy costs.

With decades of experience in research and applications of infrared technology, Star Progetti has been able to develop infrared heaters that offer maximum heat efficiency. With equal energy consumption, our electric infrared heaters guarantee 30% greater heating power than many other heaters on the market.

This is the reason why Star Progetti has been recently chosen for heating one of the world's largest glass structure: the Zaryadye park in Moscow

The company has one 16.000-square-metre factory in Milan, in Tribiano and a 5000-square-metre facility in Cuisery (France).

Product description

Electric Infrared heaters

Star Progetti's electric infrared heaters can be used for heating only the areas required and only for the time required. Just like the sun, the infrared rays move through the air and heat the objects exposed to them. Heat thus remains localized only in the areas where it's effectively required, without any dispersion.

Star Progetti electric infrared heaters are the ideal solution for buildings or large indoor (e.g. hangar, pressostatic covering, etc.) or outdoor areas (e.g. grandstand, bleachers, under parasols and awnings, etc.) where a conventional heating system cannot be used or would be difficult to install or result in excessive energy costs.

With Star Progetti electric infrared heaters, the heat remains localized in the areas frequented by people, and does not disperse up towards ceilings or towards any openings

Evaporative Air Coolers

Star Progetti's evaporative air coolers cool the air naturally, creating a pleasant microclimate in areas frequented by people.

The functioning principle is entirely natural: the hot air passes through cellulose honeycomb panels that are wet with water during the cooling cycle. Simply by contact and the natural effect of evaporation, the heat contained in it is dispersed, generating a flow of cool, natural air.

The air, filtered and cooled, draws the heat away from the area, creating a fresh sense of relief, just as occurs in nature near the sea or a waterfall.

Unlike air conditioning systems, it can be used in large opened indoor spaces and outdoors for cooling training fields during the hot season.
